Location Services

Introduction
A location-based service (LBS) is an information system driven by the ability of the ‘central’ system to detect the geographical position of the mobile devices.
Location Services

Introduction
Location Based Services are used in a variety of situations, such as 
commercial,
entertainment,
emergency,
health,
work,
personal life, etc.

Examples:
• Locate the nearest bank, restaurant, gas station, hotel, golf course, 
hospital, police station, etc.
• Provide transportation information on how to go from ‘here’ to ‘there’.
• Social networking is used to locate and reach events, friends and family members.
How the Global Positioning System (GPS) Works?

Originally created by DOD-USA under the name NAVSTAR (Navigation System for Timing and Ranging) but it is commonly known as Global Positioning System (GPS).

The system’s backbone consists of 27 Earth-orbiting satellites (24 in operation and 3 in stand-by mode)

Each satellite circles the globe at about 12,000 miles, making two complete rotations every day.

The disposition of orbiting satellites is set so that at any time there are at least four of them in range to any point on earth.

Location Services

How the Global Positioning System (GPS) Works?

The image highlights the orbit of satellite CHINASAT-5A.

See:
NASA Satellite Tracking
http://science.nasa.gov/realtime/jtrack/3d/JTrack3D.html/
How the Global Positioning System (GPS) Works?

2-D Trilateration
As an example, assume a person is located at the following relative position:

--- Miami 1795 km
--- Caracas 1874 km
--- Bogota 1251 km

STEP1
Draw a circle centered in Miami. Scale its radius to 1795 Km.

Observe that not enough information is available for a definitive fix to be made, the person could be anywhere on the blue circle.
Location Services

How the Global Positioning System (GPS) Works?

2-D Trilateration

**STEP 2**
Draw a second circle centered in Caracas, Venezuela. Scale its radius to 1874 Km.

Two intersection points appear: one on the Caribbean Ocean, an another in Central America.
How the Global Positioning System (GPS) Works? / Trilateration

---

Miami 1795 km
Caracas 1874 km
Bogota 1251 km
---

**STEP3**
Draw a final circle centered in Bogota, Colombia. Set radius to 1251 Km.

The three circles now intersect on the point over Central America.

The actual location is: San Jose, Costa Rica.
3D-Trilateration

Rather than circles three spheres intersect to define your GPS receiver’s location.

Location Services

Cell Tower Triangulation
An alternative method to determine the location of a cell phone is to estimate its distance to three nearby cell towers.

*Distance* of the phone to each antenna could be estimated based upon the *lag time* between the moment the tower sends a *ping* to the phone and receives the answering ping back.

Quite similar to the 2D-Trilateration Method.

Location Services

Latitude & Longitude

Latitude in GPS-Decimal notation: +90.000000 (North) to -90.000000 (South)
Longitude GPS-Decimal notation: +180.000000 (East) to -180.000000 (West)
Location Services

Android Location Classes

The Android API provides Location data based on a variety of methods including: *Cell Tower Triangulation*, and most commonly *GPS chip readings*.

*GPS is the most common location provider on the Android based phones.*

It offers the most accuracy.

## Android Location Classes

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Address</strong></td>
<td>A class representing an Address, i.e., a set of strings describing a location.</td>
</tr>
<tr>
<td><strong>Criteria</strong></td>
<td>A class indicating the application criteria for selecting a location provider.</td>
</tr>
<tr>
<td><strong>Geocoder</strong></td>
<td>A class for handling geocoding.</td>
</tr>
<tr>
<td><strong>GpsSatellite</strong></td>
<td>This class represents the current state of a GPS satellite.</td>
</tr>
<tr>
<td><strong>GpsStatus</strong></td>
<td>This class represents the current state of the GPS engine.</td>
</tr>
<tr>
<td><strong>Location</strong></td>
<td>A class representing a geographic location sensed at a particular time (a &quot;fix&quot;).</td>
</tr>
<tr>
<td><strong>LocationManager</strong></td>
<td>This class provides access to the system location services.</td>
</tr>
<tr>
<td><strong>LocationProvider</strong></td>
<td>An abstract superclass for location providers</td>
</tr>
</tbody>
</table>
# Location Services

## Android Location Interfaces

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GpsStatus.Listener</td>
<td>Used for receiving notifications when GPS status has changed.</td>
</tr>
<tr>
<td>GpsStatus.NmeaListener</td>
<td>Used for receiving NMEA sentences from the GPS.</td>
</tr>
<tr>
<td>LocationListener</td>
<td>Used for receiving notifications from the <code>LocationManager</code> when the location has changed.</td>
</tr>
</tbody>
</table>
Location Services

Location Class

- A class representing a geographic location sensed at a particular time (a "fix").
- A location consists of a latitude and longitude, a UTC timestamp and optionally information on altitude, speed, and bearing.
- Information specific to a particular provider or class of providers may be communicated to the application using `getExtras`, which returns a Bundle of key/value pairs.
- Each provider will only provide those entries for which information is available.

<table>
<thead>
<tr>
<th>CONSTANTS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location.<strong>FORMAT</strong>_DEGREES**</td>
<td>Constant used to specify formatting of a latitude or longitude in the form <code>[+-]DDD.DDDDD</code> where D indicates degrees.</td>
</tr>
<tr>
<td>Location.<strong>FORMAT</strong>_MINUTES**</td>
<td>Constant used to specify formatting of a latitude or longitude in the form <code>&quot;[+-]DDD:MM.MMMMM&quot;</code> where D indicates degrees and M indicates minutes of arc (1 minute = 1/60th of a degree).</td>
</tr>
<tr>
<td>Location.<strong>FORMAT</strong>_SECONDS**</td>
<td>Constant used to specify formatting of a latitude or longitude in the form <code>&quot;[+-] DDD:MM:SS.SSSSSS&quot;</code> where D indicates degrees, M indicates minutes of arc, and S indicates seconds of arc (1 minute = 1/60th of a degree, 1 second = 1/3600th of a degree).</td>
</tr>
</tbody>
</table>
## Location Services

### Location Class – Useful Methods

<table>
<thead>
<tr>
<th>Type</th>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td><code>distanceBetween</code></td>
<td>Computes the approximate distance in meters between two locations, and optionally the initial and final bearings of the shortest path between them.</td>
</tr>
<tr>
<td>float</td>
<td><code>getAccuracy</code></td>
<td>Returns the accuracy of the fix in meters.</td>
</tr>
<tr>
<td>double</td>
<td><code>getAltitude</code></td>
<td>Returns the altitude of this fix.</td>
</tr>
<tr>
<td>float</td>
<td><code>getBearing</code></td>
<td>Returns the direction of travel in degrees East of true North.</td>
</tr>
<tr>
<td>Bundle</td>
<td><code>getExtras</code></td>
<td>Returns additional provider-specific information about the location fix as a Bundle.</td>
</tr>
<tr>
<td>double</td>
<td><code>getLatitude</code></td>
<td>Returns the latitude of this fix.</td>
</tr>
<tr>
<td>double</td>
<td><code>getLongitude</code></td>
<td>Returns the longitude of this fix.</td>
</tr>
<tr>
<td>String</td>
<td><code>getProvider</code></td>
<td>Returns the name of the provider that generated this fix, or null if it is not associated with a provider.</td>
</tr>
<tr>
<td>float</td>
<td><code>getSpeed</code></td>
<td>Returns the speed of the device over ground in meters/second.</td>
</tr>
<tr>
<td>long</td>
<td><code>getTime</code></td>
<td>Returns the UTC time of this fix, in milliseconds since January 1, 1970.</td>
</tr>
</tbody>
</table>
**Location Services**

**Location Manager**
This class provides access to the system location services.

These services allow applications

1. To *obtain periodic updates of the device's geographical location*,

2. or to fire an application-specified **Intent** when the
   *device enters the proximity of a given geographical location*.

You do not instantiate this class directly; instead, retrieve it through

`Context.getSystemService(Context.LOCATION_SERVICE)`
## Location Manager – Useful Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>addProximityAlert</code> (double latitude, double longitude, float radius, long expiration, <code>PendingIntent</code> intent)</td>
<td>Sets a proximity alert for the location given by the position (latitude, longitude) and the given radius.</td>
</tr>
<tr>
<td><code>getBestProvider</code> (Criteria criteria, boolean enabledOnly)</td>
<td>Returns the name of the provider that best meets the given criteria.</td>
</tr>
<tr>
<td><code>getGpsStatus</code> (GpsStatus status)</td>
<td>Retrieves information about the current status of the GPS engine.</td>
</tr>
<tr>
<td><code>getLastKnownLocation</code> (String provider)</td>
<td>Returns a Location indicating the data from the last known location fix obtained from the given provider.</td>
</tr>
<tr>
<td><code>getProvider</code> (String name)</td>
<td>Returns information associated with the location provider of the given name, or null if no provider exists by that name.</td>
</tr>
<tr>
<td><code>getProviders</code> (Criteria criteria, boolean enabledOnly)</td>
<td>Returns a list of the names of LocationProviders that satisfy the given criteria, or null if none do.</td>
</tr>
<tr>
<td><code>requestLocationUpdates</code> (String provider, long minTime, float minDistance, <code>PendingIntent</code> intent)</td>
<td>Registers the current activity to be notified periodically by the named provider.</td>
</tr>
<tr>
<td><code>requestLocationUpdates</code> (String provider, long minTime, float minDistance, <code>LocationListener</code> listener)</td>
<td>Registers the current activity to be notified periodically by the named provider.</td>
</tr>
<tr>
<td><code>setTestProviderStatus</code> (String provider, int status, <code>Bundle</code> extras, long update)</td>
<td>Sets mock status values for the given provider.</td>
</tr>
</tbody>
</table>
Location Services

LocationListener Class

Used for receiving notifications from the LocationManager when the location has changed.

These methods are called if the LocationListener has been registered with the location manager service using the method:

requestLocationUpdates (Provider, minTime, minDistance, LocationListener)

</tr>
<tr>
<td>abstract boolean</td>
<td><strong>supportsBearing()</strong>&lt;br&gt;Returns true if the provider is able to provide bearing information, false otherwise.</td>
</tr>
<tr>
<td>abstract boolean</td>
<td><strong>supportsSpeed()</strong>&lt;br&gt;Returns true if the provider is able to provide speed information, false otherwise.</td>
</tr>
</tbody>
</table>

**Constants:**
- LocationProvider.AVAILABLE
- LocationProvider.OUT_OF_SERVICE
- LocationProvider.TEMPORARILY_UNAVAILABLE
Location Services

LocationProvider Class

An *abstract superclass* for location providers.

A location provider *supplies periodic reports on the geographical location of the device.*

Each provider has a set of criteria under which it may be used; for example, some providers require GPS hardware and visibility to a number of satellites; others require the use of the cellular radio, or access to a specific carrier's network, or access to the internet.

They may also have *different battery consumption* characteristics or *monetary costs* to the user.

The **Criteria** class allows providers to be selected based on user-specified criteria.
Location Services

Example – Obtain Location Coordinates

In this example we request GPS services and display latitude and longitude values on the UI. Additionally we deliver an SMS with this information.

Notes

1. Observe the GPS chip is not a synchronous device that will immediately respond to a “give me a GPS reading” call.

2. In order to engineer a good solution that takes into account the potential delays in obtaining location data we place the UI in the main activity and the request for location call in a background service.

3. Remember the service runs in the same process space as the main activity, therefore for the sake of responsiveness we must place the logic for location data request in a separate parallel thread.

4. A thread (unlike an Activity) needs the presence of a Looper control to manage IPC message sending. This implies and additional Looper.prepare and Looper.loop methods surrounding the locationUpdate method.
Location Services

Example – Obtain Location from GPS
Example. Obtaining & Mapping a Location Using Its Coordinates

In this example we create a background service to gather location data from various sources (Network, GPS chip, wi-fi, ...)

The user may invoke an Intent to show a Google Map depicting the location
Location Services

Example – Mapping and Sharing a Location.

**GPS Emulation**

Use the DDMS > Emulator Control panel to enter test data reflecting *Latitude* and *Longitude*.

Select emulator 5554.

On panel “**Location Controls**” enter coordinates.

Press the ‘Send’ button to transmit the data.
Location Services

Example – Obtain Location Coordinates – Layout 1 of 2

```xml
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:orientation="vertical" >

    <LinearLayout
        android:layout_width="match_parent"
        android:layout_height="wrap_content"
        android:background="#ffeeeeee" >

        <Button
            android:id="@+id/btnDrawMap"
            android:layout_width="wrap_content"
            android:layout_height="wrap_content"
            android:layout_gravity="center"
            android:layout_margin="6dp"
            android:text="Draw Map" />

        <Button
            android:id="@+id/btnStartService"
            android:layout_width="wrap_content"
            android:layout_height="wrap_content"
            android:layout_gravity="center"
            android:layout_margin="6dp"
            android:text="Start Service" />
    </LinearLayout>
</LinearLayout>
```
Location Services

Example – Obtain Location Coordinates – Layout 2 of 3

```xml
<Button
    android:id="@+id/btnStopService"
    android:layout_width="wrap_content"
    android:layout_height="wrap_content"
    android:layout_gravity="center"
    android:layout_margin="6dp"
    android:text="Stop Service" />
</LinearLayout>

<TextView
    android:id="@+id/txtTopLine"
    android:layout_width="match_parent"
    android:layout_height="wrap_content"
    android:text="Coordinates"
    android:textAppearance=?android:attr/textAppearanceSmall" />

<ScrollView
    android:layout_width="match_parent"
    android:layout_height="wrap_content"
    android:layout_margin="7dp"
    android:background="#ffffff66" />

<LinearLayout
    android:layout_width="match_parent"
    android:layout_height="wrap_content" />
```
<TextView
    android:id="@+id/txtMsg"
    android:layout_width="0dp"
    android:layout_height="wrap_content"
    android:layout_margin="3dp"
    android:textSize="12sp" />
</LinearLayout>
</ScrollView>
</LinearLayout>
Location Services

Example – Obtain Location Coordinates – Manifest

```xml
<?xml version="1.0" encoding="utf-8"?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    package="cis493.mappinggps"
    android:versionCode="1" android:versionName="1.0">
    <uses-sdk android:minSdkVersion="8" />
    <uses-permission android:name="android.permission.INTERNET" />
    <uses-permission android:name="android.permission.ACCESS_FINE_LOCATION" />
    <application
        android:icon="@drawable/ic_menu_compass"
        android:label="@string/app_name"
        android:theme="@android:style/Theme.Holo.Light">
        <activity
            android:name=".MyGPS"
            android:configChanges="orientation"
            android:label="@string/app_name"
            android:screenOrientation="portrait">
            <intent-filter>
                <action android:name="android.intent.action.MAIN" />
                <category android:name="android.intent.category.LAUNCHER" />
            </intent-filter>
        </activity>
        <service android:name="MyGpsService" />
    </application>
</manifest>
```
Location Services
Example – Obtain Coordinates - Main Activity: MyGps

// Request GPS location, show lat & long, optionally draw a map
package cis493.mappinggps;
import ...

public class MyGPS extends Activity implements OnClickListener {
    TextView txtMsg;
    Button btnStopService;
    Button btnDrawGoogleMap;

    }

    public void onStatusChanged(String provider, int status, Bundle extras) {
    }
    // GPSListener class

}; // MyGpsService
Location Services

JARGON:

Bearing

is the angle (East-ward) between a line connecting two points (source, destination) and a north-south line, or meridian.

NMEA (National Marine Electronics Association)

The NMEA 2000 standard contains the requirements for the minimum implementation of a serial-data communications network to interconnect marine electronic equipment onboard vessels. Equipment designed to this standard will have the ability to share data, including commands and status, with other compatible equipment over a single signaling channel.

Reference:  http://www.nmea.org/content/nmea_standards/white_papers.asp

UTC - Coordinated Universal Time

Is a time standard based on International Atomic Time (TAI) with leap seconds added at irregular intervals to compensate for the Earth's slowing rotation.

Location Services

Keyhole Markup Language

Use Eclipse’s **DDMS > Emulator Control > KML** tab to provide location data to your emulator using a KML file.

**Example:** File *my_location_data.kml* contains the following set of placemarks

```xml
<?xml version="1.0" encoding="UTF-8"?>
<kml xmlns="http://earth.google.com/kml/2.2">
  <Placemark>
    <name>Station 46027</name>
    <description>Off the coast of Lake Earl</description>
    <Point>
      <coordinates>-124.38,41.85,0</coordinates>
    </Point>
  </Placemark>
  <Placemark>
    <name>Station 46020</name>
    <description>Outside the Golden Gate</description>
    <Point>
      <coordinates>-122.83,37.75,0</coordinates>
    </Point>
  </Placemark>
  <Placemark>
    <name>Station 46222</name>
    <description>San Pedro Channel</description>
    <Point>
      <coordinates>-118.31,33.61,0</coordinates>
    </Point>
  </Placemark>
</kml>
```

Appendix: Skyhook Location Services
(Excerpts taken from www.skyhookwireless.com)

Skyhook’s Core Engine is a software-only location system that quickly determines device location with 10 to 20 meter accuracy.

A mobile device with Skyhook's Core Engine collects raw data from each of the location sources (GPS, towers, wi-fi).

The Skyhook client then sends this data to the Location Server and a single location estimate is returned.

The client is optimized so that it communicates with the Location Server only when the location cannot be determined locally.

This behavior minimizes the user's data cost while maximizing battery life.
Appendix: Skyhook Location Services

www.skyhookwireless.com

“Skyhook's is a software-only location system that determines device location with 10 to 20 meter accuracy.”

Skyhook’s raw data comes from:
• Wi-Fi access points,
• GPS satellites and
• cell towers

Supported platforms include:
• Android
• Linux
• Mac OS X
• Windows
Appendix: Skyhook Location Services  www.skyhookwireless.com

PROS:
• Promises to work well in confined physical spaces (such as very developed urban areas)
• Better battery life (no need for constant GPS-chip readings)

CONS:
• Poor documentation available (Dec 2012)
• Unreliable at times (you may get very inaccurate fixes, or none at all)
• Not appropriate for rural areas, current coverage focuses mostly on USA and European cities.
• Vulnerable to spoofing location attacks (the attacker could convince the device to be in a false location. See http://www.syssec.ch/press/location-spoofing-attacks-on-the-iphone-and-ipod )
Appendix: Skyhook Location Services  www.skyhookwireless.com

Coverage Area (Dec 2012)
